# SAFETY PRECAUTION

## WARNING

Service should not be attempted by anyone unfamiliar with the necessary precautions on this monitor. The followings are the necessary precautions to be observed before servicing.

1. Always discharge the high voltage to the CRT conductive coating before handling the CRT.  
The picture tube is highly evacuated and if broken, glass fragments will be violently exploded. Use shatterproof goggles and keep picture tube away from the bare body while handling.
2. When replacing a chassis in the cabinet, always be certain that all the protective devices are put back in place, such as non-metallic control knobs, insulating covers, shields, isolation resistor-capacitor network etc.
3. Before returning the monitor to the customer, always perform an AC leakage current check on the exposed metallic parts of the cabinet, such as signal connectors, terminals, screw heads, metal overlays, control shafts etc, to be sure the monitor is safe to operate without danger of electrical shock. Plug the AC line cord directly into a AC outlet (do not use a line isolation transformer during this check.). Use an AC voltmeter having 1500 ohm per volt or more sensitivity in the following manner : Connect ground(water pipe, conduit, etc.) and the exposed metallic parts, one at a time. Measure the AC Voltage across the combination of 1500 ohm resistor and 0.15 $\mu$ F capacitor. Reverse the AC plug at the AC outlet and repeat AC voltage measurements for each exposed metallic part. The Voltage must not exceed 0.3 volts RMS. This corresponds to 0.2 milliamp AC. Any value exceeded this limit constitutes a potential shock hazard and must be corrected immediately.

# **X-RAY RADIATION PRECAUTION**

1. Excessive high voltage can produce potentially hazardous X-RAY RADIATION. To avoid such hazards, the high voltage must be under the specified limit. The nominal value of the high voltage of this monitor is  $25KV \pm 0.5KV$  at zero beam current(minimum brightness) under a 120V AC power source. The high voltage must not(under any circumstances) exceed 28KV. Each time a monitor requires servicing, the high voltage should be checked.  
It is recommended the high voltage be recorded as a part of the service record. It is important to use an accurate and reliable high voltage meter.
2. This monitor is equipped with a protection circuit which prevents the monitor from producing excessively high voltage. Each time the monitor is serviced, the protection circuit must be checked to determine that the circuit is properly functioning.
3. The only source of X-RAY RADIATION in this monitor is the picture-tube.  
For continued X-RAY RADIATION protection, the replacement tube must be exactly the same type tube as specified in the parts list.
4. Some parts in this monitor have special safety-related characteristics for X-RAY RADIATION protection.  
For continued safety, parts replacement should be undertaken only after referring to the product safety notice.

## **PRODUCT SAFETY NOTICE**

Many electrical and mechanical parts in this monitor have special safety-related characteristics. These characteristics are often not evident from visual inspection.

Replacement parts which have these special safety characteristics are identified in this manual; electrical components having such features identified by " " in the replacement parts list and schematic diagram.

For continued protection, replacement parts must be identical to those used in the original circuit. The use of substitute replacement parts which do not have the same safety characteristics as the factory recommended replacement parts shown in this service manual, may create shock, fire, X-RAY RADIATION or other hazards.

## CONNECTING WITH EXTERNAL EQUIPMENT

### Cautions

Be sure to turn off the power of your computer before connecting the monitor.

# THEORY OF OPERATION

## 1. Power Supply

The AC line voltage range is from 90V to 264V.

The SMPS has +55V, +70V, +6.3V, +12V, +24V.

The inlet connector with a EMI filter is used to reduce the noise from the power supply.

The conducted noise is filtered by inlet (LF101), X and Y capacitors (C101~103) and a common mode line filter (L101).

The input rectifier section (BD101) converts the AC line voltage into a DC voltage to power the SMPS.

The KA3842B (U101) drives the power FET(Q102) according to the PWM signals generated by the  $R_T$  and  $C_T$  (R111, R117, C105) connected pin 4 of U101.

The KA3842 (U101) is an integrated current mode PWM.

It consists of an oscillator, error amplifier, current sense comparator, under voltage lock-out and an MOSFET drive stage.

The switching frequency is locked to horizontal scan frequency by horizontal flyback pulse from sync transformer (T102).

## 2. DPMS and Selftest mode.

The power supply supports the DPMS function. Its operation is shown in the table below.

MODE	H-Sync	V-Sync	MCU PIN 12	BRI MCU PIN 29	CONT MCU PIN 30	MCU PIN 17	MCU PIN 11	Q103	Q108	12V	6.3V
NORMAL	O	O	GND	Control		H	H	ON	ON	12V	6.3V

SUSPEND	O	X	GND	0V		L	H	OFF	ON	0V	6.3V
OFF	X	X	GND	0V		L	L	OFF	OFF	0V	0V

## 3. Signal Processing and MCU Control

When the H and V sync or TTL composite sync are input to MCU, MCU can measure the H and V frequency to detect the video mode. MCU has digital to analog converter (DACs) control function like R/G/B Cut-off, side pincushion, R/B gain, H-size, H-position, V-size, V-position, Trapezoid, brightness, contrast and tilt. (PWM 0~PWM13)

The operation of MCU is shown in the table below.

H-Freq. [kHz]	H-LIN 1 PIN 18	H-LIN 3 PIN 19	H-LIN 2 PIN 20	Co PIN 23	Remark.
$H < 33$	L	L	L	L

#### 4. Horizontal Deflection

STV7778(U301) is a monolithic IC for H/V sync and drive processing. In phase comparator between sync and oscillator(PLL2), DC controls for phase, frequency and output duty setting. When H-sync applied, the internal oscillator is automatically locked. The duty cycle of H-output pulse(pin 21) is 48%.

Q312 and T301 are used to drive the H-output transistor(Q311). Q311 is turned on, it conducts current through the deflection yoke on the right hand side of the screen. This current comes from the S correction capacitors (C339, 341, 342, 344), which have a charge equal to the effective supply voltage.

When the Q311 is opened up, the damper diode(D308) allows current for left hand side of the screen to flow back through the deflection yoke to the S capacitors.

The flyback capacitor (C338) determines the size and length of the flyback pulse. The S capacitors correct outside versus center linearity in the horizontal scan.

Two FETs (Q309, 310) and relay (RL301) select the value of S capacitors. H-centering is controlled by a switch (SW301). The switch selects DC offset current flow through the yoke.

A diode modulator is used to control the E-W correction and H-size. STV7778 (U301) generates the E-W parabola wave using vertical ramp. A DAC is used to control the amplitude of E-W parabola, H-size. A power buffer (Q316, Q317) drives the diode modulator.

In order to keep the high voltage constant independent of the horizontal scan frequency, the supply voltage of FBT must increase with increasing scan frequency proportionally. A step-up mode DC/DC converter with PWM is used to realize this demand. STV7778 (U301) compares High Voltage feedback with Reference voltage. Its output pulse switches a FET(Q315). To adjust the High Voltage, STV7778(U301) has a control Terminal (Pin 39).

#### 5. Vertical Deflection

In vertical section of STV7778 (U301), there is auto-sync processing.

The vertical output stage consists of a power OP-AMP with extra flyback generator. TDA9302H (U201) is used as vertical output stage.

#### 6. X-ray Protection and Beam Current Limiting.

A failure in the horizontal scan control section could cause a dangerous situation; the high voltage might rise to an unacceptable high level. When the flyback voltage rises to unacceptable level, STV 7778 (U301 Pin16) detects these states (under 1.6V).

It causes the H-drive stage and oscillator to be turned off. Then high voltage is shut down until the power switch is on again.

The average anode current is measured at lower side of the High Voltage winding of the FBT. The anode current flows through resistor R502, 503 connected against +12V. When the anode current increases, the voltage across R503 increases also. The base voltage of Q501 drops so contrast control voltage is limited.

#### 7. Video Amplifier and OSD Interface

MC13282AP (U401) is a wide band video amplifier with three matched video amplifiers, contrast control, OSD interface, OSD contrast control, drive controls, blanking gate and clamp gate. H blank signal is applied to pin24. During blanking all three outputs are thrown to the pedestal level. A inserted H-Sync is used to a clamp signal. The signal is applied to pin 23.

Three OSD inputs (pin8, 10, 12 of U401) are TTL compatible and typical bandwidth is 50MHz.

A fast commutate pin is provided to select either the video or the OSD inputs as a source for the amplification.

OSD contrast control (pin 11 of U401) is also provided for the amount of amplification required when OSD inputs are selected.

MC141540P4 (U403) is a high performance HCMOS device designed to interface with a micro controller unit (U601) to allow colored symbols or characters to be displayed on the monitor screen.

The output stage is made of 3-channel power amplifier (U402, LM2405). The output capable of 40 volts swing in less than 12 n Sec.

The three cathodes are AC coupled to the video amplifiers. The DC level on each cathode is set by a cut-off amplifier and clamp diode. The value of the DC voltage is adjusted by DACs.

# TROUBLE SHOOTING

## 1. Introduction
